EXPERIMENT 5

UI DESIGN USING RAD MODEL

AIM

To design and develop a shopping application user interface using the RAD model in Axure RP.

INTRODUCTION

User Interface (UI) design is an important part of software development that focuses on improving user experience. A welldesigned UI helps users to interact easily with the system.

The RAD (Rapid Application Development) model is a software development approach that emphasizes quick design, development, and feedback. It allows developers to create prototypes quickly and improve them based on user input.

In this experiment, a shopping application interface is designed using Axure RP by following the RAD model.

DESCRIPTION

In this experiment, a shopping application interface was created using Axure RP by following the RAD (Rapid Application Development) model. The application allows users to browse products, view details, add items to cart, and place orders.

METHODOLOGY

The RAD model consists of four phases

Requirements Planning

The features of the application were identified such as product listing, cart management, and order confirmation. User actions like browsing, selecting, and purchasing were considered.

User Design

The interface was designed using Axure RP. Multiple screens were created including product list, cart page, product details, and order success page. UI elements like images, buttons, and text were used.

Construction

The screens were connected using interactions. Navigation between pages was implemented using OnClick events. The prototype was tested using preview mode.

Cutover

The final design was reviewed and demonstrated. The application flow was verified and made ready for presentation.

METHODOLOGY

The shopping application was developed by following the RAD model:

Phase 1: Requirements Planning

The main features of the application were identified:

- Viewing products
- Checking product details
- Adding items to cart

- Placing orders

User actions such as browsing, selecting, and purchasing products were considered.

Phase 2: User Design

The interface was designed using Axure RP. Multiple screens were created:

- Product List Page
- Product Details Page
- Cart Page
- Order Success Page

UI elements like buttons, images, text, and icons were used to create a clean and user-friendly design.

Phase 3: Construction

The prototype was developed by connecting all screens using interactions. Navigation between pages was implemented using OnClick events.

Examples:

- Clicking a product opens the product details page
- Clicking “Add to Cart” navigates to the cart page
- Clicking “Proceed” shows the order confirmation page

The prototype was tested using preview mode.

Phase 4: Cutover

The final design was reviewed and tested. All functionalities were verified. The project was then demonstrated successfully.

IMPLEMENTATION

The developed application consists of the following screens:

Product List Page

This page displays all available products with images and prices. It allows users to browse items easily.

Product Details Page

This page shows detailed information about a selected product including image, price, and description. It also includes an “Add to Cart” button.

Cart Page

This page displays the selected items along with total price. It provides an option to proceed with the order.

Order Success Page

This page confirms that the order has been placed successfully and provides a completion message.

OBSERVATION

- The RAD model helps in faster UI development
- Axure RP makes it easy to design interactive prototypes
- The application flow is smooth and user-friendly

RESULT

Thus, the shopping application user interface was successfully designed and implemented using Axure RP by following the RAD model. The application provides a simple and effective user experience.
